RESEARCH FOR THE NFPA MISSION

Carbon Monoxide Incidents: A Review of the Data Landscape

There are multiple sources which provide Carbon Monoxide (CO) incident data including but not limited to: Consumer Product Safety Commission (CPSC), Center for Disease Control and Prevention (CDC), U.S. Fire Administration (USFA), and standard development organizations such as the National Fire Protection Association (NFPA) and the International Codes Council (ICC). Each organization contains its own methodology for collecting information and providing statistics; however, it is not clear what specific information is being collected, disseminated, and represented for each incident type.

New requirements for the installation of CO detection into several types of occupancies (both new and existing occupancies) are being addressed in the 2024 editions of NFPA 101 Life Safety Code® and NFPA 5000, Building Construction and Safety Code®. There is a lack of understanding regarding the data available for non-fire CO incidents, specifically for commercial-type occupancies.

The goal of this project is to review and present the carbon monoxide incident data landscape to clarify the sources of information, how the data is compiled and what the data represents. Additionally, this project identifies, summarizes, and analyzes case studies of non-fire carbon monoxide incidents specific to commercial-type occupancies to provide a greater understanding to the NFPA technical committees responsible for NFPA 101 Life Safety Code® and NFPA 5000, Building Construction and Safety Code®

Summary Observations

The purpose of this project is to review and present the carbon monoxide (CO) incident data landscape to clarify the sources of information, how the data is compiled and what the data represents. Additionally, this project identifies, summarizes, and analyzes case studies of non-fire carbon monoxide incidents specific to commercial-type occupancies to provide a greater understanding to the technical committees responsible for developing NFPA 101, Life Safety Code® and NFPA 5000, Building Construction and Safety Code®.

Eight databases and additional data sources hosting information on CO incidents were reviewed to identify insights and limitations in the data. Databases that contained information on occupancies experiencing CO incidents were evaluated to identify contributing factors, etc. Overall, it was found that databases providing CO incident information did not provide a sufficient level of detail to fully understand the CO exposure problem in the U.S.

Of the databases that capture information on occupancy type, CPSC is the only database that includes incidents occurring in a full range of occupancies. CPSC, because it is consumer product centric, is biased towards residential incidents, and OSHA, because it is work-related, is biased towards commercial occupancies. As such, neither of these two databases offer a balanced view of the issue at hand.

While all databases show that incidents are occurring in a wide range of occupancies, and many of these occupancies are not required to have CO detection, these limited datasets do not provide a national-level appreciation of CO incident occurrence frequencies. Moreover, the limited datasets do not provide a comprehensive view of injuries and deaths resulting from CO incidents, nor are they correlated by occupancy type. Therefore, the frequency of CO incidents occurring in all types of commercial occupancies is unknown. A critical piece of information needed to determine if current requirements for CO detection are adequate. Moreover, the limited dataset which details the location of the victim relative to the CO source. As such, there is no way to determine, using these datasets alone, if current CO detection placement criteria, e.g., distance from the space with CO source, is adequate.

Background

Research Goals:

- 1) Review and present the CO incident data landscape to clarify the sources of information, how the data is compiled and what the data represents.
- 2) Identify, summarize & analyze case studies of non-fire CO incidents specific to commercial-type occupancies

Project Tasks

1

- Identify Currently Available Data Sources

2

- CO Incident Data Collection

3

- Final Report

Databases Analyzed

Source	Database
Centers for Disease Control and Prevention (CDC)	National Environmental Public Health Tracking
Centers for Disease Control and Prevention (CDC)	WONDER (Death Rate Datasets)
Consumer Product Safety Commission (CPSC)	National Electronic Injury Surveillance System (NEISS)
Institute of Health Metrics and Evaluation (IHME)	Global Health Data Exchange Registry
National Transportation Safety Board (NTSB)	Aviation Accident Database & Synopses
National Highway Transportation Safety Administration (NHTSA)	Fatality Analysis Reporting System
Occupational Safety and Health Administration (OSHA)	Collection of Accident Data related to CO poisonings
United States Fire Administration (USFA)	National Fire Incident Reporting System

Database name, managing agency, web link

Primary Purpose/Objective

Collecting Data since _____

Type of Data Collected

Inclusion/Exclusion Criteria

Advantages/Limitations

Insights to be derived from the data

Insights that cannot be derived from the data

CDC – National Environmental Public Health Tracking

Purpose: Provides data about health effects due to CO poisoning

Advantages:

- US Map and simple dropdown menus to change visuals
- Updated annually.
- Results shown for 1-, 3-, and 5-year increments
- Presents average rates based on population size

Limitations:

- Hospitalization data sets do not include info on race/ethnicity
- No info on occupancy type.

CDC Wonders

Purpose: Provides public health information related to death rates in the US

Advantages:

- User interface is menu-driven and simple to query.
- Data is updated annually.

Limitations:

- Does not delineate death by CO poisoning from “accidentally poisoning by and exposure to other gases and vapors”
- No info re. occupancy type

CPSC – Collection of Injury Statistics and Technical Reports Related to CO Incidents

Purpose: Provides collection of published reports on CO incidents due to consumer products

Advantages:

- Digestible summaries of findings for each product.
- Include incidences and consequences of incidents
- Many reports include narratives for additional context.

Limitations:

- Delayed publishing
- Narrow scope (almost all incidents involve use tools are in residential occupancy)
- Deals only with fatalities, not injuries

CPSC – National Electronic Injury Surveillance System (NEISS)

Purpose: Collect details of consumer product-related injuries that have occurred within the US

Advantages:

- Easy to use query system with extensive list of parameters
- Provides excel file with related cases and related narrative.

Limitations:

- Must have specific search codes; cant look up “CO incidents”
- Cannot sort by occupancy

IHME – Global Health Data Exchange Registry

Purpose: Provides researchers access to a large amount of health-related data

Advantages:

- Can highlight age, sex, or location
- Appealing and digestible visualizations
- Can output data in Death, YLDs, or DALYs

Limitations:

- Does not specialize in particular incidents
- Some data are only available in summary visualizations
- Does not offer breakdown of data (by occupancy, ethnicity, context, etc.)

National Fire Incident Reporting System (NFIRS)

Purpose: Public data release of incidents reported by U.S. Fire Dept.

Advantages:

- Tens of millions of incidents in U.S. reported each year.
- Provides description of each incident.

Limitations:

- Potential unknown fields
- Data lags a few years behind. Most recent datasets currently available from 2019.
- No specific exclusion criteria but minor incidents may go unreported at the discretion of responders completing the form.
- Not all FD participate (24k/27k)

National Highway Traffic Safety Administration (NHTSA) – Fatality Analysis Reporting System

Purpose: Nationwide census that collects data related to fatal injuries suffered in motor vehicle traffic crashes

Advantages:

- User interface simplified query for CO incidents

Limitations:

- Datasets apply only to motor vehicle incidents
- Little detail about the information queried (yes/no for each input)

National Transportation Safety Board (NTSB) – Aviation Accident Database & Synopses

Purpose: Reports summarizing civil aviation accidents and incidents

Advantages:

- Detailed reports on each accident provides a great deal of specific info

Limitations:

- Only for accidents/incidents occurring in aircraft.
- Difficult/Impossible to filter accidents related to CO exposure
- Searching for data from many incidents requires reviewing each report.

OSHA – Accident Database

Purpose: Provides a list of summaries of OSHA investigations into fatal or injurious workplace accidents.

Advantages:

- Database of workplace accidents, most or all accidents are in commercial occupancies in the database.
- Easy to filter to show CO incidents only.

Limitations:

- Does not provide the specific occupancy the injury occurred in, though, this can be inferred.

Project Tasks

1

- Identify Currently Available Data Sources

2

- CO Incident Data Collection

3

- Final Report

Task 2: Data on Commercial Occupancies

Based upon findings from Task 1, the following databases and data sources will be utilized to collect information relevant to commercial occupancies:

- NFIRS
- OSHA
- CPSC
- Hotel/Motel Incident Data

Review NFPA 101, 5000, and IBC to determine requirements for CO detection

Findings

- While all databases show that incidents are occurring in commercial occupancies
- The limited datasets do not allow for:
 - a national-level appreciation of CO incident occurrences or frequencies.
 - a comprehensive view of injuries and deaths resulting from CO exposure correlated by occupancy type.
- The frequency of injuries occurring in all types of commercial occupancies is unknown; **this is a critical piece of information needed to determine if current requirements for CO detection are adequate.**
- There is no dataset which details the location of the victim relative to the CO source.
 - No way to determine, using these datasets alone, if current CO detection placement criteria, e.g., detector in space with CO source, is adequate.

by NCOAA

A Review of the Carbon Monoxide Alarm and Detection Thresholds

Research Goal

Examine the current literature to determine if new information exists regarding the levels of CO that are potentially dangerous for various populations. Identify knowledge gaps and provide recommendations for future research to address the gaps.
